Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1. (currently amended) A two-phase coating system comprising:
 - at least one catalyst;
- a liquid phase, comprising one or more polymer binders cross-linkable by polar reaction; and

a separate dry sprinkleable powder phase, comprising <u>a solid carrier material</u> <u>and</u> at least a part of the catalyst and/or of a precursor of the catalyst which forms the catalyst in reaction with a co-reactive compound in the liquid phase; wherein

the separate dry sprinkleable powder phase is formulated for sprinkling on a coating of the liquid phase, after application of a coating of the liquid phase to a substrate.

- 2. (previously presented) The two-phase coating system according to claim 1, wherein at least one catalyst includes a Lewis acid or Lewis base.
- 3. (previously presented) The two-phase coating system according to claim 1, wherein the liquid phase comprises a compound which is reactive with a precursor in the powder phase to form a Lewis base or Lewis acid after the liquid phase is exposed to the powder phase.
- 4. (previously presented) The two-phase coating system according to claim 1, wherein the liquid phase is a two-component composition, the first component comprising one or more polyisocyanates and the second component comprising a polythiol, polyol, polyamine or mixtures thereof.
- 5. (withdrawn) The two-phase coating system according to claim 1, wherein the liquid phase is a two-component composition, the first component comprising one ore more polyepoxies and the second component comprising one or more polythiols.

- 6. (withdrawn) The two-phase coating system composition according to claim 1, wherein the liquid phase is a two-component composition, the first component comprising a polyunsaturated binder and at least one electron-withdrawing group linked to a carbon atom of at least one of the unsaturated bonds, the second component comprising a polythiol and/or a compound comprising acidic CH groups.
- 7. (previously presented) The two-phase coating system according to claim 3, wherein the powder phase comprises one or more phosphine compounds and in that the liquid phase comprises one or more electron-deficient olefins.
- 8. (previously presented) The two-phase coating system according to claim 1, wherein the powder phase comprises one or more amines.
- 9. (previously presented) The two-phase coating system according to claim 1, wherein the catalyst in the powder phase is a solid material in powder form.
- 10. (cancelled).
- 11. (currently amended) The two-phase coating system according to claim 1, wherein the powder comprises [[a]] the solid carrier material in powder form having one or more of the activating compounds adsorbed to its surface.
- 12. (previously presented) The two-phase coating system according to claim 11, wherein the carrier material is sand, diatomaceous earth, zeolite, vitreous beads, barium sulphate, chalk, pigment, or mixtures thereof.
- 13. (previously presented) The two-phase coating system according to claim 12, wherein the powder material is titanium dioxide coated with a zirconium compound.
- 14. (previously presented) The two-phase coating system according to claim 12, wherein the carrier material comprises a mixture of sand having an average particle size above 200 micrometers and a fine sand having an average particle size below 100 micrometers.

- 15. (previously presented) The two-phase coating system according to claim 14, wherein the composition comprises more than about 60 wt. % of sand having an average particle size between 300-800 micrometers, 15-30 wt. % of quartz sand having an average particle size of 20-90 micrometers, and a fine grade quartz sand having an average particle size below 10 micrometers.
- 16. (previously presented) The two-phase coating system according to claim 1, wherein the powder phase comprises up to about 8 wt. % of the catalyst.
- 17. (withdrawn) Method of applying a coating composition comprising in a liquid phase one or more polymer binders cross-linkable by polar reaction and in a separate dry powder phase at least one catalyst wherein after application of one or more layers of the liquid phase on a substrate, the powder phase is sprinkled over the wet liquid phase layer.
- 18. (withdrawn) Method of applying a coating composition comprising in a liquid phase one or more polymer binders cross-linkable by polar reaction and in a separate dry powder phase at least one precursor of a catalyst which forms the catalyst in reaction with a co-reactive compound in the liquid phase wherein after application of a layer of the liquid phase on a substrate, the powder phase is sprinkled over the wet liquid phase layer.
- 19. (withdrawn) Method according to claim 17, characterised in that the thickness of the freshly applied layer of liquid phase is less than the particle size of at least a part of the powder phase material, and in that after sprinkling the powder phase over the wet liquid phase layer, a second layer of the liquid phase is applied.
- 20. (previously presented) The two-phase coating system according to claim 14, wherein it comprises more than about 60 wt. % of sand having an average particle size between 300-800 micrometers, 15-30 wt. % of quartz sand having an average particle size of 20-90 micrometers, and a fine grade quartz sand having an average particle size below about 3 micrometers.

Appl. No. 10/567,331 Response to October 27, 2009 Final Office Action Page 5

- 21. (previously presented) The two-phase coating system according to claim 16, wherein the powder phase comprises up to about 5 wt. % of the catalyst.
- 22. (previously presented) The two-phase coating system according to claim 16, wherein the powder phase comprises up to about 3 wt. % of the catalyst.
